

Genomic correspondence and exon-span observations

Shared coordinates depend on qualified whole-locus sequence evidence

A Genomic alignment

annotated physical exon intervals

Species 1

Species 2

Shared alignment coordinates

B Interval correspondence

collinear matches, ordered locally

Order + strand + shared sequence

Sequence-qualified local chain

C Tip observations

E Qualified exon-span observation
physical interval on genomic DNA

⊘ DNA absence
paired flanks support the call

? Unknown or conflicting
mapping / annotation unresolved

Physical intervals define genomic exon-span geometry.
Unknown status retains any known DNA constraints.
